

ARAM GEVORKYAN

Motivational Letter

Dear Admissions Committee,

I am applying for a Computer Science degree because I am interested in how computer systems work and how they can be used to solve practical problems. My interest started when I first used an old PC given to me by my cousin at a young age, and it has continued to grow since then.

In school, I gained basic knowledge in computing, mathematics, and physics. These subjects helped me develop logical thinking and understand how computer systems and hardware function. A computing teacher also introduced me to basic data analysis and showed me my first interest in cybersecurity.

Outside of school, I gained practical experience by supporting my father in managing his company's databases. This taught me how important structure, accuracy, and responsibility are when working with data. It also increased my interest in cybersecurity.

I later began learning more about cybersecurity independently and supported related tasks within my father's company. This helped me improve my ability to organize tasks, work with others, and take responsibility for smaller projects.

In my free time, I practice woodcraft and wrestling. Both activities have helped me develop discipline, patience, and time-management skills.

I would like to study Computer Science in Germany because of its strong technical education and practical approach. I am particularly interested in cybersecurity because I enjoy analytical thinking and structured problem-solving. My goal is to build a strong foundation in computer science and develop my understanding of secure systems.

Thank you for considering my application.

Kind regards,

Aram Gevorkyan
